# Data Example: Station E03

Station E03

- $\phi_{xy} \approx \phi_{yx}$ , but  $\rho_{xy} \approx \mathcal{S} * \rho_{yx}$
- shapes of  $\rho_{xx}$  and  $\rho_{yy}$  similar to  $\rho_{xy}$

Looks like effect of full distortion matrix

$$\mathbf{C} = \begin{pmatrix} C_{xx} & C_{xy} \\ C_{yx} & C_{yy} \end{pmatrix}$$

$$\tilde{\mathbf{Z}} = \mathbf{CZ}$$

Sasaki and Meju (2006) demonstrate encouraging results with their joint inversion of MT resistivity and static shifts(not full distortion matrix).

$$\varphi_d(\boldsymbol{\sigma}, \mathbf{C}) = \frac{1}{2} \sum_{i=1}^{N_S} \sum_{j=1}^{N_T} \beta_{ij} \operatorname{tr} \left[ \bar{\mathbf{A}}_{ij}^T(\boldsymbol{\sigma}, \mathbf{C}) \mathbf{A}_{ij}(\boldsymbol{\sigma}, \mathbf{C}) \right] \quad (1)$$

$\mathbf{A}_{ij} = \mathbf{C}_i \mathbf{Z}_{ij} - \mathbf{D}_{ij}$   $2 \times 2$  matrices

$\mathbf{Z}_{ij}$  complex-valued predicted  $\mathbf{Z}(\mathbf{r}_i, \omega_j)$  impedance

$\mathbf{D}_{ij}$  complex-valued observed  $\mathbf{D}(\mathbf{r}_i, \omega_j)$  impedance

$\mathbf{C}_i$  real-valued  $\mathbf{C}(\mathbf{r}_i)$  distortion matrix

$$\operatorname{tr} \left[ \bar{\mathbf{A}}^T \mathbf{A} \right] = \bar{A}_{11} A_{11} + \bar{A}_{12} A_{12} + \bar{A}_{21} A_{21} + \bar{A}_{22} A_{22}$$

$$\varphi(\boldsymbol{\sigma}, \mathbf{C}, \lambda, \nu) = \varphi_d(\boldsymbol{\sigma}, \mathbf{C}) + \lambda\varphi_s(\boldsymbol{\sigma}) + \nu\psi_s(\mathbf{C}) \xrightarrow{\boldsymbol{\sigma}, \mathbf{C}} \min \quad (2)$$

$\varphi_d(\boldsymbol{\sigma}, \mathbf{C})$  Data misfit

$\varphi_s(\boldsymbol{\sigma})$  Roughness measure

$\psi_s(\mathbf{C})$  To impose constraint on the distortion

$$\psi_s(\mathbf{C}) = \frac{1}{2} \sum_{i=1}^{N_S} \text{tr}[(\mathbf{C} - \mathbf{I})^T (\mathbf{C} - \mathbf{I})], \mathbf{I} - \text{identity matrix}$$
