Traditionally solution is sought as a stationary point of a penalty function

$$\varphi(\mathbf{m}, \lambda) = \varphi_d(\mathbf{m}) + \lambda \varphi_s(\mathbf{m}) \underset{\mathbf{m}}{\longrightarrow} \min \quad (1)$$

$\varphi_d(\mathbf{m})$  data misfit

$\varphi_s(\mathbf{m})$  Tikhonov-type stabilizer

$\lambda$  regularization parameter

$\mathbf{m}$  vector of model parameters (conductivities)

$$\varphi_d(\mathbf{m}) = \frac{1}{2} \| \mathbf{d}^{obs} - \mathcal{F}(\mathbf{m}) \|^2 \quad (2)$$

$\mathcal{F}(\mathbf{m})$  is a forward problem mapping

$$\varphi_s(\mathbf{m}) = \frac{1}{2} \| \mathbf{W}(\mathbf{m} - \mathbf{m}^{ref}) \|^2 \quad (3)$$

$\mathbf{m}^{ref}$  vector of model parameters, for some reference model, which usually include some a priori information.

All iterative methods work at the same manner. At each iteration / they find:

- 1 a search direction vector  $\mathbf{p}^{(I)}$
- 2 a step length  $\alpha^{(I)}$  using an inexact line search along  $\mathbf{p}^{(I)}$
- 3 the next, improved model given by  $\mathbf{m}^{(I+1)} = \mathbf{m}^{(I)} + \alpha^{(I)}\mathbf{p}^{(I)}$

The difference is in how a specific method finds the search direction and in what price is paid for this.

$$\text{NLCG } \mathbf{p}^{(I)} = -\mathbf{g}^{(I)} + \gamma^{(I)}\mathbf{p}^{(I-1)}, \text{ where } \gamma^{(I)} = \frac{\mathbf{g}^{(I)} \cdot \mathbf{g}^{(I)}}{\mathbf{g}^{(I-1)} \cdot \mathbf{g}^{(I-1)}}$$

$$\text{Newton, GN } \mathbf{H}^{(I)}\mathbf{p}^{(I)} = -\mathbf{g}^{(I)}$$

$$\text{QN } \{\mathbf{m}^{(i)}, \mathbf{g}^{(i)} : i = 1, \dots, I\} \rightarrow \mathbf{p}^{(I)}$$

$$\text{LMQN } \{\mathbf{m}^{(i)}, \mathbf{g}^{(i)} : i = I - n_{cp}, \dots, I\} \rightarrow \mathbf{p}^{(I)}$$

$$H_{ij}^{(I)} = \frac{\partial^2 \varphi}{\partial m_i \partial m_j}(\mathbf{m}^{(I)}), \quad g_i^{(I)} = \frac{\partial \varphi}{\partial m_i}(\mathbf{m}^{(I)})$$

Conclusions

References

- Calculation of gradients requires 2 forward modellings at each frequency
- **Important:** Straightforward calculation of the gradients would require  $N + 1$  forward modellings, i.e. in  $\approx N/2$  times more

Example: number of model parameters = 3000

Single forward modelling requires  $\approx 4$  min on PC

$\Rightarrow$  Straightforward calculation of the single gradient requires 8 days

Usually  $\approx 200$  iterations(gradients) is needed

$\Rightarrow$  Total inversion time is  $\approx 4$  years.

$$\varphi_d(\sigma) = \frac{1}{2} \sum_{i=1}^{N_S} \sum_{j=1}^{N_T} \beta_{ij} \operatorname{tr} [\bar{\mathbf{A}}_{ij}^T(\sigma) \mathbf{A}_{ij}(\sigma)] \quad (4)$$

$\sigma = (\sigma_1, \dots, \sigma_N)^T$  the vector of the electrical conductivities of the cells,  $N$  number of cells

$N_S$  number of MT sites  $\mathbf{r}_i = (x_i, y_i, z = 0)$

$N_T$  number of frequencies  $\omega_j$

$\mathbf{A}_{ij} = \mathbf{Z}_{ij} - \mathbf{D}_{ij}$   $2 \times 2$  matrices

$\mathbf{Z}_{ij}$  complex-valued predicted  $\mathbf{Z}(\mathbf{r}_i, \omega_j)$  impedance

$\mathbf{D}_{ij}$  complex-valued observed  $\mathbf{D}(\mathbf{r}_i, \omega_j)$  impedance

$\beta_{ij}$  some positive weights

$$\operatorname{tr} [\bar{\mathbf{A}}^T \mathbf{A}] = \bar{A}_{11} A_{11} + \bar{A}_{12} A_{12} + \bar{A}_{21} A_{21} + \bar{A}_{22} A_{22}$$

$$\frac{\partial \varphi_d}{\partial \sigma_k} = \text{Re} \left\{ \sum_{j=1}^{N_T} \sum_{p=1}^2 \int_{V_k} \left( \mathbf{u}_x^{(p)} \mathbf{E}_x^{(p)} + \mathbf{u}_y^{(p)} \mathbf{E}_y^{(p)} + \mathbf{u}_z^{(p)} \mathbf{E}_z^{(p)} \right) dV \right\} \quad (5)$$

## Maxwell's equation

$$\nabla \times \nabla \times \mathbf{E}_j^{(p)} - \sqrt{-1} \omega_j \mu \sigma(\mathbf{r}) \mathbf{E}_j^{(p)} = \sqrt{-1} \omega_j \mu \mathbf{J}_j^{(p)} \quad (6)$$

## Adjoint Maxwell's equation

$$\nabla \times \nabla \times \mathbf{u}_j^{(p)} - \sqrt{-1} \omega_j \mu \sigma(\mathbf{r}) \mathbf{u}_j^{(p)} = \sqrt{-1} \omega_j \mu \left( \mathbf{j}_j^{(p)} + \nabla \times \mathbf{h}_j^{(p)} \right) \quad (7)$$

$\mathbf{j}_j^{(p)}$  and  $\mathbf{h}_j^{(p)}$  - horizontal electric and magnetic dipoles at the MT sites  
 $p = 1, 2$  - polarization

The forward modelling is performed with *X3D* by (Avdeev *et al.*, 2002).
